Short Notes for MUL CX and DIV BL:

MUL CX

- a. MUL always uses AX (or its extended versions EAX or RAX) as the implicit destination register.
- b. The operand size determines the size of the result:
 - i. Byte-sized operand: Result in AX
 - ii. Word-sized operand: Result in DX:AX
 - iii. Doubleword-sized operand (32-bit mode): Result in EDX:EAX
 - iv. Quadword-sized operand (64-bit mode): Result in RDX:RAX

- c. The upper half of the result (DX or EDX or RDX) holds any overflow bits.
- d. The Carry Flag (CF) is set if the upper half of the product is non-zero.

DIV BL

- a. DIV always uses the DX:AX or EDX:EAX pair as the implicit dividend register.
 - b. The divisor is specified as the operand of the DIV instruction.
 - c. The quotient is stored in AX (for 16-bit division) or EAX (for 32-bit division).
 - d. The remainder is stored in DX.
 - e. Clear DX (or EDX for 32-bit division) before division to ensure a correct 16-bit or 32-bit dividend.
 - f. If the divisor is 0, a division error occurs.
 - g. The Overflow Flag (OF) is set if the quotient is too large to fit in the destination register.
-
