## Objective

The objective of this assignment is to use Flutter to design and develop a basic application that allows users to record, manage and delete their daily activities. The application helps to provide an easy-to-use interface for organizing daily activities with time or category.

## Description of the System

The application called Daily Activities Recorder developed using the Flutter framework. It allows users to:

- Enter an activity name
- Enter the time or category of the activity
- Save the activity to a list
- View all added activities
- Delete activities from the list

It stores activities temporarily in memory using a list, which means the data will reset when the app is restarted.

## Explanation of the Interface

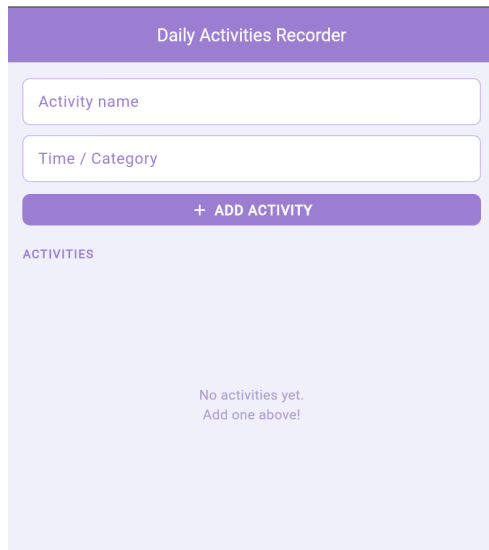

The application has a single screen with a light purple (#9B7FD4) theme. It is divided into 2 sections: an input form at the top and an activity list at the bottom. AppBar displays the centered title “Daily Activities Recorder” in white text on a light purple background. The debug banner is disabled for a clean look. Some components is used in this app:

1. **Activity Name TextField:** Allows the user to enter the activity name. It uses TextEditingController to read and clear the input value.
2. **Time/Category TextField:** Allows the user to enter time or category. This field uses its own TextEditingController independent of the activity name field.
3. **Add Activity Button:** A button that triggers the `_addActivity()` function when pressed. It validates that both fields are filled in before inserting a new Activity object and calling `setState()` to refresh the UI. If either field is empty, a SnackBar error message is displayed.
4. **Activity List:** Each list item is presented as a card widget showing the activity name and time/category. The list rebuilds automatically whenever `setState()` is called.
5. **Delete Button:** A red button displayed on the right side of each activity card. When tapped, it opens a confirmation dialog asking the user to confirm deletion. If confirmed, the activity is removed from the list using `setState()`. If cancelled, no changes are made.
6. **Confirmation Dialog:** An alert dialog that appears when the user taps the Delete button. It displays the name of the activity to be deleted and provides 2 options: cancel(dismisses the dialog) and delete(a red button that confirms and removes the activity).

## Screenshots of the App

In this lab assignment, the Google platform was selected as the primary interface due to limitations of the Android emulator, including severe lag and recurring pop-up notifications that affected its responsiveness.

### Main screen

## Delete Confirmation Dialog

## Conclusion

In conclusion, the Daily Activities Recorder app successfully demonstrates the use of Flutter to build a functional and user friendly application. The app allows users to manage their daily activities efficiently through a simple interface. Although the app currently stores data temporarily, it can be further improved by integrating a database for permanent storage and adding more advanced features like editing activities or setting reminders.
