Proposal – PBe Online Banking

LECTURER: DR. HARMI IZZUAN BIN BAHARUM

Student Name	Matric No.
TEH RU QIAN	A23CS0191

Proposal: Public Bank Berhad (PBe Online Banking)

Category: Bank

Subcategory: PBe Online Banking

Introduction

Mobile banking has become known as an essential tool in the current digital era, allowing consumers to quickly and easily complete financial transactions. One of the banks in Malaysia, Public Bank Berhad, provides services include bill payment, fund transfers and QR transactions through the PBe Online Banking. However, many of users have complained about the app's performance, especially because of its frequent latency and crashes, which have seriously impacted its reliability and usage.

According to data collected from Google Play Store reviews in 2024, 46% of negative comments mention slow loading or freezing, 29% report unsuccessful fund transfers because of system errors and 18% voice concerns about transaction duplication caused on by lag. These numbers show widespread technical inefficiencies that undermine consumer satisfaction and trust. For all PBe users to have a more smooth, reliable and secure mobile banking experience, Public Bank must resolve this issue.

Problem

The main problem with Public Bank's PBe mobile application is that it **frequently crashes and performs slowly**, which issues with crucial transactions including bill payments, fund transfers and QR payments.

Several technical factors contribute to this problem. First, when user activity increases by more than 60%, **server overload** during peak usage, especially on salary crediting days, results in delays and unexpected app crashes. Second, the app is unsuitable for older or less powerful devices due to its **poor coding architecture**, which results in a high memory consumption of about 380–410 MB. Finally, **poor network optimisation** causes frozen screens or unsuccessful transactions for those with unstable 4G or Wi-Fi connections. All these problems together highlight the critical need for performance optimisation to improve the stability and responsiveness of the PBe mobile application.

Solution

Public Bank should improve its infrastructure and system to ensure better scalability and optimization in solving these issues.

1. Migration to Cloud-Based Servers

Automatic resource allocation during peak hours would be possible by switching from conventional in-house servers to scalable cloud servers such as AWS or Azure Banking Cloud. This ensures stable performance and reduces downtime, even in the event of a sudden 70% increase in concurrent users.

2. Application Code Optimization

Code reworking will increase processing speed, decrease freezing and improve the

app's response on older devices. The current PBe framework should be reorganised with lightweight APIs and modular coding architecture to reduce memory consumption by at least 30%.

3. Beta Testing and User Feedback Integration

A closed beta testing process that involves PBe users can assist identify frequent latency issues before new versions are released to the public. Continuous user feedback loops help speed up improvement cycles and reduce post-release problems.

Justification

The proposed amount of RM200,000 will be wisely spent to improve the stability and performance of PBe Online Banking. Approximately RM90,000 will be used to the migration of current systems to scalable cloud architecture, which would enable automatic resource allocation during periods of high peak and reduce server overload. Another RM70,000 will be spent on optimising the app's coding architecture to improve memory efficiency, reduce lag and ensure smoother performance across devices. The remaining RM40,000 will be used for beta testing and the creation of a user feedback system so that real users can report problems and help with ongoing development. This investment will provide a more reliable, efficient and user-centred mobile banking experience, resulting in lower app crash rates, smoother transaction processing and increased customer trust in Public Bank's online platform.

Conclusion

Public Bank has a serious technical problem because of the PBe mobile banking application's frequent crashes and poor performance. These problems can be successfully reduced by implementing cloud-based infrastructure and optimised app architecture. In addition, to increasing transaction reliability and user satisfaction, improving the app's stability will boost public trust in Public Bank's commitment to innovation and excellent customer service in the age of digital banking.
